

Appl. No. 10/710,743  
Response Dated December 15, 2005  
Reply to Office Action Dated September 28, 2005

**Amendments to the Specification:**

Please replace the Abstract with the following paragraph:

A method and apparatus is ~~provided to sample~~ useful for sampling formation fluid from a subterranean formation. Formation fluid is drawn from the subterranean formation into ~~the~~ a downhole tool and collected in a sample chamber. An exit flow line is operatively connected to the sample chamber for selectively removing a contaminated and/or clean portion of the formation fluid from the sample chamber whereby contamination is removed from the sample chamber. For example, a clean portion of the formation fluid may be passed to another sample chamber for collection, or a contaminated portion may be dumped into the borehole.
